Abstract

The Heavy Metal Tested & Certified heavy-metal-safety standard for cans/lids in Food-Contact Consumer Goods and Kitchenware, evaluated on specific element migration INTO FOOD OR A FOOD SIMULANT from the polymeric food-contact surface, µg/kg of food, determined by the Reg (EU) 10/2011 Annex III to V simulant, temperature and contact-time conventions. This is a MIGRATION basis and not a total-content basis: no cell on this row limits how much of an element the material CONTAINS, and no cell on this row is expressed per kg of material.. 7 of 11 panel analytes publish a numeric limit taken from the strictest applicable government maximum; the remainder are held under mandatory control or a substantiated not-material determination.

1 | How every number on this standard is set

HMTc Method v2.0 (government-limit-only): the strictest applicable sovereign maximum for this exact product form expressed as specific element migration into food or a food simulant; a disclosed read-across from the nearest applicable sovereign value in the same basis where the food-contact material family is expressly excluded from or not reached by that instrument; a substantiated not-material determination; or a control. No cell is occurrence-derived, and no cell borrows a value across a basis.

2 | Master limit table

All values in ppb (µg/kg), as_sold basis. A brand meeting every value qualifies for the mark.

ANALYTE	TIER	HMTC LIMIT	BASIS
Lead (Pb)	Tier 1	10	human-grade read-across (European Union)

Cadmium (Cd)	Tier 1	2	human-grade read-across (European Union)
Total arsenic (tAs)	Tier 2	10	human-grade read-across (European Union)
Inorganic arsenic (iAs)	Tier 1	n/m	not material in this matrix
Mercury, total (tHg)	Tier 1	10	human-grade read-across (European Union)
Methylmercury (MeHg)	Tier 1	n/m	not material in this matrix
Nickel (Ni)	Tier 2	20	human-grade read-across (European Union)
Tin (Sn)	Tier 2	control	measured every lot; no human-food maximum
Aluminium (Al)	Tier 2	1,000	human-grade read-across (European Union)
Total chromium (Cr)	Tier 2	10	human-grade read-across (European Union)
Hexavalent chromium (Cr-VI)	Tier 2	n/m	not material in this matrix

3 | Derivation — where each number comes from

Every cell traces to one named sovereign maximum level (the strictest for the nearest analog), or to an explicit control, not-material, or species-bounded determination. No occurrence statistic selects a certification value.

ANALYTE	HMTC	SOVEREIGN ANALOG / DETERMINATION
Lead (Pb)	10	European Union — human-food analog
Cadmium (Cd)	2	European Union — human-food analog
Total arsenic (tAs)	10	European Union — human-food analog

Inorganic arsenic (iAs)	n/m	Inorganic arsenic is a dietary speciation with no separate food-contact-material instrument anywhere in the credible set: every food-contact element requirement is written on total arsenic. Arsenic migrating from a polymeric food-contact article is in any case inorganic, so the total-arsenic non-detect requirement is simultaneously the tightest achievable inorganic-arsenic ceiling and bounds this cell by identity. No separate inorganic-arsenic ceiling is published, and inorganic arsenic never substitutes for the total-arsenic cell.
Mercury, total (tHg)	10	European Union — human-food analog
Methylmercury (MeHg)	n/m	Methylmercury is formed by microbial methylation in aquatic food chains. A cured polymer, a fired glaze, a metal alloy and a coated article contain no methylation pathway, and no credible sovereign sets a methylmercury requirement for any food-contact material. The total-mercury non-detect requirement bounds any organomercury fraction that could be present. No separate methylmercury ceiling is published, and methylmercury never substitutes for the total-mercury cell.
Nickel (Ni)	20	European Union — human-food analog

Tin (Sn)	control	Regulation (EU) 10/2011 Annex II lists no tin entry, and no credible sovereign sets a tin migration or release ceiling for a can, a can end or any other food-contact article. Tin is the defining pathway of this row, so a control here is a mandatory determination and not a shrug: tin dissolves from exposed tinplate wherever the interior lacquer is absent, thin or breached, which is why the sovereign response to canned-food tin is a maximum level on the FOOD rather than on the article. Those food maximum levels (EU Reg 2023/915 at 200 mg/kg for canned foods and 100 mg/kg for canned beverages, Codex CXS 193 and FSANZ Schedule 19 at 250 mg/kg, and 50 mg/kg for canned infant and young-child products) are disclosed as a companion obligation on the contents. They are a FOOD basis, they are measured in the food and not in a simulant against the article, and republishing one of them as this row's migration ceiling would be the exact basis conflation this category's guard exists to prevent.
Aluminium (Al)	1,000	European Union — human-food analog
Total chromium (Cr)	10	European Union — human-food analog

Hexavalent chromium (Cr-VI)	n/m	Regulation (EU) 10/2011 Annex II point 2 controls hexavalent chromium through the total-chromium requirement rather than through a separate species limit: total chromium must be not detectable, and the relaxed 3.6 mg/kg food value becomes available only where the operator documents that chromium(VI) is absent. HMTc declines that relaxation, so every certified article is held to total chromium not detectable at 0.01 mg/kg food, which bounds hexavalent chromium at or below the same value. No credible sovereign sets a hexavalent-chromium migration limit for a food-contact material, so no separate species ceiling is published; hexavalent chromium never substitutes for the total-chromium cell.
