Abstract

The Heavy Metal Tested & Certified heavy-metal-safety standard for non-root vegetables (fruiting, brassica, bulb, stem and legume vegetables) in Fruits, Vegetables, and Produce, evaluated on fresh or frozen vegetable as sold, wet weight, edible portion after washing and separation of the edible part. 6 of 11 panel analytes publish a numeric limit taken from the strictest applicable government maximum; the remainder are held under mandatory control or a substantiated not-material determination.

1 | How every number on this standard is set

HMTc Method v2.0 (government-limit-only; the strictest applicable sovereign maximum level for the row's product form in the row's native basis, a disclosed read-across where the exact cell is unregulated, a substantiated not-material determination, or a control; never occurrence-derived)

2 | Master limit table

All values in ppb (µg/kg), as sold basis. A brand meeting every value qualifies for the mark.

ANALYTE	TIER	HMTC LIMIT	BASIS
Lead (Pb)	Tier 1	50	government maximum level
Cadmium (Cd)	Tier 1	20	government maximum level

Total arsenic (tAs)	Tier 2	100	government maximum level
Inorganic arsenic (iAs)	Tier 1	60	government maximum level
Mercury, total (tHg)	Tier 1	10	government maximum level
Methylmercury (MeHg)	Tier 1	control	measured every lot; no human-food maximum
Nickel (Ni)	Tier 2	400	government maximum level
Tin (Sn)	Tier 2	n/m	not material in this matrix
Aluminium (Al)	Tier 2	control	measured every lot; no human-food maximum
Total chromium (Cr)	Tier 2	500	screening ceiling (Hong Kong)
Hexavalent chromium (Cr-VI)	Tier 2	n/m	not material in this matrix

3 | Derivation — where each number comes from

Every cell traces to one named sovereign maximum level (the strictest for the nearest analog), or to an explicit control, not-material, or species-bounded determination. No occurrence statistic selects a certification value.

ANALYTE	HMTC	SOVEREIGN ANALOG / DETERMINATION
Lead (Pb)	50	government maximum level
Cadmium (Cd)	20	government maximum level
Total arsenic (tAs)	100	government maximum level
Inorganic arsenic (iAs)	60	government maximum level
Mercury, total (tHg)	10	government maximum level

Methylmercury (MeHg)	control	No credible sovereign government sets a methylmercury maximum level for this product form: asensio2023-madrid--mushrooms-mercury measured methylmercury in this matrix, so the species is not absent and no not-material determination is supportable. Methylmercury is therefore held under mandatory analytical control rather than recorded not-material, and it remains bounded by identity below the published total-mercury ceiling for this row (methylmercury cannot exceed total mercury). No methylmercury ceiling is invented.
Nickel (Ni)	400	government maximum level
Tin (Sn)	n/m	Every tin maximum level in the register is scoped to canned product: EU Reg. 2023/915 sets 200000 ug/kg for canned foods and 100000 ug/kg for canned beverages, Codex CXS 193-1995 and AU-NZ Schedule 19 set 250000 ug/kg for canned foods, and Hong Kong Cap. 132V sets 250000 ug/kg for canned food other than canned beverages. Those limits regulate one contamination pathway, dissolution of tin from tinplate into the packed food. This row is not packed in tinplate, so the pathway that every sovereign tin limit addresses is physically absent and any tin present is dietary background rather than packaging migration. Fresh and frozen vegetables in this row are sold loose, bagged, netted or in polymer trays. Hermetically sealed tinplate presentations of this commodity route to the canned-foods row in Category 7 and carry the canned-foods tin maximum level there.

Aluminium (Al)	control	No credible sovereign government sets an aluminium contaminant maximum level for any fruit, vegetable or produce form in any jurisdiction. The register's aluminium limits are drinking-water and bottled-water parameters, infant-formula maximum levels, a food-contact plastics specific migration limit, toy migration limits, and permitted-additive levels for baked and starch foods; none of them regulates aluminium as a contaminant of produce. Aluminium is also the third most abundant element in the earth's crust and appears in produce largely as soil-derived and root-associated mineral content rather than as process contamination, so no near-neighbour read-across is supportable either. Under the government-limit-only method HMTc publishes no standalone aluminium number for this row.
Total chromium (Cr)	500	government maximum level

Hexavalent chromium (Cr-VI)	n/m	No credible sovereign government sets a hexavalent-chromium maximum level for any solid food in any jurisdiction. The register's only INGESTED Cr(VI) parameters are drinking-water maxima (Australia NHMRC 2025, 50 ug/L, nhmrc2025_crvi_drinking_water_-50; California SWRCB, 10 ug/L, us_ca_swrcb_2024_cr-vi_-chromium-hexavalent_mcl_10ugl and ca_swrcb_crvi_drinking_water_-10), which are water-basis parameters expressed per litre of a consumed liquid and supply no applicable ceiling for a solid produce row in this row's native basis; every remaining Cr(VI) row in the register is an article or material limit (toys, textiles, leather, fertilisers, electrical equipment). Chromium in produce is dominated by nutritionally essential Cr(III), and Cr(VI) is not stable in the plant matrix: fruit and vegetable tissue is an aqueous, organic-acid and ascorbate-rich reducing medium in which Cr(VI) is reduced to Cr(III), so a reported Cr(VI) value in this matrix reflects extraction conditions rather than the chromium species the consumer ingests. Hexavalent chromium is therefore bounded by the published total-chromium screen for this row (Hong Kong Cap. 132V item 7, 500 ug/kg) and controlled by reflex speciation rather than by a published number.
